Abstract of the Disclosure

A process for transmission of data sets between at least one server and a client, a display data set on the server being accessible to the client via a connection to the server. The display data is automatically retrieved from the server, transmitted to the client and displayed from the client. A request for inputting of response data is sent automatically from the client to the user of the client at least partially overlapping in time with the display of the display data set which takes place from the client based on a query data set which is different from the display data set. Additionally, for example, a modified Internet browser with a backward channel can be implemented, with which any Internet pages can be displayed, questioning can take place simultaneously with these Internet pages and the corresponding response data can be collected and evaluated centrally on the feedback server.
